

RRDS26 Workshop 2 Activity 1

Quarto

1. Install RStudio or Positron. If using **R**, install the **rmarkdown** package:
install.packages("rmarkdown"), which should install all packages needed to render the Quarto documents.
2. Open up a new Quarto file and start playing around with it!
 - a. Add text, equations, code chunks, images, etc.
 - b. Render it using **output: html**, **output: typst**, and **output: pdf** (if you have LaTeX installed). If you don't have LaTeX installed and want to render as pdf, you can install TinyTeX using **install.packages("tinytex")** and then **tinytex::install_tinytex()** in **R**.
 - c. Try rendering it with slides using **output: revealjs** and/or **output: pptx**. Slide breaks are added by putting **## Slide Title** on its own line.
3. Try running the code from Workshop 1 in Quarto and add some text around it so it reads more like a report.
